

Designation: D4653 – 87 (Reapproved 2020)

## Standard Test Method for Total Chlorides in Leather<sup>1</sup>

This standard is issued under the fixed designation D4653; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

*This standard has been approved for use by agencies of the U.S. Department of Defense.*

### 1. Scope

1.1 This test method is intended for use in determining total chlorides in mineral tanned leather.

1.2 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.*

1.4 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

### 2. Referenced Documents

2.1 ASTM Standards:<sup>2</sup>

**D2813** Practice for Sampling Leather for Physical and Chemical Tests

### 3. Significance and Use

3.1 This test method is used to determine amount of soluble chlorides in leather.

### 4. Apparatus

4.1 Volumetric Flask, 250 mL.

### 5. Reagents

5.1 Acetic Acid Solutions—5 or 10 % by volume.

5.2 Methyl Orange—0.02 % solution in 50 % alcohol.

5.3 Ammonium Hydroxide Solution, (0.1 N).

5.4 Silver Nitrate, Standard Solution, (0.1 N).

5.5 Potassium Chromate Solution, 5 %.

### 6. Sampling, Test Specimens and Test Units

6.1 The test specimen shall consist of 1 g of leather from the composite sample in accordance with Practice **D2813**.

6.2 Two specimens from the composite sample shall be tested.

### 7. Procedure

7.1 Weigh the specimen to the nearest milligram and record the value as *W*. Transfer the specimen to a 250 mL volumetric flask and add 200 mL of 0.1 N ammonium hydroxide solution. Immerse the flask up to the neck in a bath of boiling water. Thoroughly wet all particles by occasional swirling. After 2 h, cool the flask to room temperature and make the flask up to volume with distilled water, shake and without delay filter through a folded filter paper.

7.2 Discard the first 20 to 25 mL of the filtrate. Pipette 200 mL of the filtrate into a 600 mL beaker, add a few drops of methyl orange indicator and neutralize with 5 % acetic acid to an orange color. Add 2 to 3 mL of 5 % potassium chromate and titrate the solution with 0.1 N silver nitrate. Record the millilitre of silver nitrate as *A*. Titrate 200 mL of distilled water containing a few drops of methyl orange indicator and 2 to 3 mL of 5 % potassium chromate with 0.1 N silver nitrate as a blank and the millilitre of silver nitrate used and recorded as *B*.

### 8. Calculation of Results

8.1 Calculate the percent total chlorides as follows:

$$\text{total chlorides, \%} = (A - B)N/W \times 0.0355 \times 250/200 \times 100 \quad (1)$$
where:

*A* = millilitres of standard silver nitrate used for titrating the sample,

*B* = millilitres of standard silver nitrate used for titrating the blank,

*N* = normality of the standard silver nitrate, and

*W* = weight of the specimen.

8.2 The total chlorides in the sample for test shall be the average of the test result obtained from the specimens tested.

<sup>1</sup> This test method is under the jurisdiction of ASTM Committee **D31** on Leather and is the direct responsibility of Subcommittee **D31.06** on Chemical Analysis.

Current edition approved April 1, 2020. Published April 2020. Originally approved in 1987. Last previous edition approved in 2015 as D4653 – 87 (2015). DOI: 10.1520/D4653-87R20.

## 9. Report

9.1 Unless otherwise specified in the detail specification, the result shall be reported to the nearest 0.1 %.

## 10. Precision and Bias

10.1 This test method is adopted from the procedures of the American Leather Chemists Association where it has long been in use and where it was approved for publication before the

inclusion of precision and bias statements were mandated. The original inter-laboratory test data is no longer available. The user is cautioned to verify by the use of reference materials, if available, that the precision and bias of this test method is adequate for the contemplated use.

## 11. Keywords

11.1 mineral tanned leather; total chlorides

*ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.*

*This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.*
